JLPT AI App, Progress Report No. 06, HP

Padauk Lab

Report	Period	Date	Prepared by
No. 06	Oct 15 to Oct 17, 2026	Oct 17, 2026	HP (Backend and Infrastructure)

You can share this file with your AI coding tool as project context, together with docs/api-contract.md and docs/database-design.md.

1. Summary

GitHub now runs our automated tests on every pull request, and a pull request can't be merged unless they pass. Setup (onboarding) and the study plan are real. Rate limits and the study screens (session, unit, Mark as done) are built and waiting for review. The content team delivered 6 units of Session 1, and all 120 words load into the database. LMHP renamed the app to 急合 (きゅうごう, Kyugo), and SWYH finished the AI follow-ups.

2. Completed by HP

No.	Task	Status
1	GitHub automatic checks: the tests run on every pull request. Merging is blocked until they pass (ruleset)	Merged (#18)
2	Real setup and study plan (contract #9, #10), contract v0.4, 23 new tests	Merged (#21)
3	Progress Report 05	Merged (#17)
4	Rate limits on log in and sign up, contract v0.5, 9 new tests	In review (#29)
5	Real session, unit and Mark as done (contract #13, #14, #15) with the unlock rules, 21 new tests	In review (#30)
6	Loaded Units 1 to 5 and 7 into the database and checked them: 120 words	Done
7	Reviewed 9 pull requests from the team (#19, #20, #22 to #28)	Done

Automated tests: 52 on main today, 82 when #29 and #30 are merged.

3. Security at a glance (new this time)

Protection	What it stops
Tests must pass before merging	Broken login or security code reaching main by accident
5 wrong passwords per email in 15 minutes, 30 log in tries per network in 5 minutes	Password guessing
20 sign ups per network per hour	Bots creating fake accounts
Unknown emails are limited the same way	Finding out who has an account
Unlock rules checked on the server	Opening locked units, quizzes or sessions by calling the API directly
Strict input checks (scores, dates, ids)	Crashes and odd data from bad or hostile requests

4. Team highlights

Member	What they did	Status
LMHP	Set the app name to 急合, slug and scheme kyugo (#19). Removed 14 unused template images and fixed the README (#28), on a fresh branch	Merged
SWYH	Moved the AI test scripts out of the app to backend/scripts/ai_eval/. Prompt v3 handles the user answered correctly (returns null), proven by a new test question. Added automatic retry when Gemini is busy (#26)	Merged
ANK	Units 1, 3, 4 and 5 of Session 1 as JSON (#20, #23, #24, #25). All readings correct, checked with the loader	Merged
Deedeedar (new)	Units 2 and 7 of Session 1 (#22, #27). Fixed the 恵み meaning after review	Merged

5. Content status

Session 1 unit	1	2	3	4	5	6	7	8	9	10
Status	Done	Done	Done	Done	Done	To do	Done	To do	To do	To do

- 6 of 200 units (3%). Grammar so far: ～をものともせず，～ならでは，～を皮切りに，～をよそに，～にかたくない，～ずにはおかない
- No quiz questions yet. Until Quiz 1 exists, units 6 to 10 stay locked for everyone (the rule working correctly)

6. Decisions made

Area	Decision
Merging	Tests must pass (green check) before any pull request can be merged
Setup answers	A score is needed for N1 and N2. Today means Japan time (contract v0.4)
Rate limits	Values above, written into contract v0.5. The app shows a Burmese please wait message on 429
Content style	Verbs in dictionary form (促す, not 促). Wave dash 〜 (U+301C) only, never ～. Words found on both N1 and N2 lists are fine
AI key names	LLM_API_KEY and LLM_MODEL everywhere (was open decision #9)
Branches	Every new task starts on a new branch from main. Don't reuse merged branches

7. Action needed (everyone)

Load the latest units into your own database after pulling main:

```
docker compose run --rm --build backend alembic upgrade head
docker compose run --rm -v "$PWD/data":/data:ro backend python -m app.content.load_units /data/units
```

Content team: run the same command with `--check` before opening a pull request.

8. Next tasks

No.	Task	Owner
1	Review #29 (rate limits) and #30 (session and unit screens)	LMHP, SWYH
2	Units 6, 8, 9 and 10 of Session 1. Decide who does Unit 6	ANK, Deedeedar
3	Quiz question format (JSON) and a quiz loader	HP
4	Quiz 1 questions for Session 1 (units 1 to 5), in that format	ANK, Deedeedar
5	Quiz endpoints (#19 to #22)	HP
6	Connect the app to the real backend: log in, setup, plan, session and unit screens	LMHP
7	Real AI functions for More examples and Why?, using LLM_API_KEY and LLM_MODEL. Test one newer Gemini model	SWYH
8	Dashboard, proverb of the day and saved words (#11, #12, #16 to #18)	HP

9. Open decisions

1. Pass prediction formula (HP and ANK to propose)
2. Exact question split in the mock test template (ANK to confirm against the N1 format)
3. Which LLM to use: gemini-2.5-flash for now, final choice after testing one newer model (SWYH)
4. Daily limit for More examples, currently 50 (team to decide after testing)
5. Quiz question bank size, so retakes get a different mix (ANK, suggestion: 40 per quiz)
6. When content is corrected, should saved Why? explanations be regenerated? (HP and SWYH, suggestion: yes)
7. If someone signs up with email, then later uses Google with the same email, join the accounts or refuse? (HP to propose)
8. Add a Japanese definition field (meaning_ja) to the contract? (team)
9. Keep frontend/.claude/settings.json (an AI tool setting) in the repo? (team)
